

Creating the New Possible with

Making machines intelligent

Pavel Konecny
Founder and CEO

Lack of Intelligence of Industrial Machinery

The problems we solve are a €120 billion-per-year opportunity to make machines smarter.

1

Creating a digital brain for machines

30t metal waste prevented

2

Machine unplanned downtime

Prevent 95% of failures

3

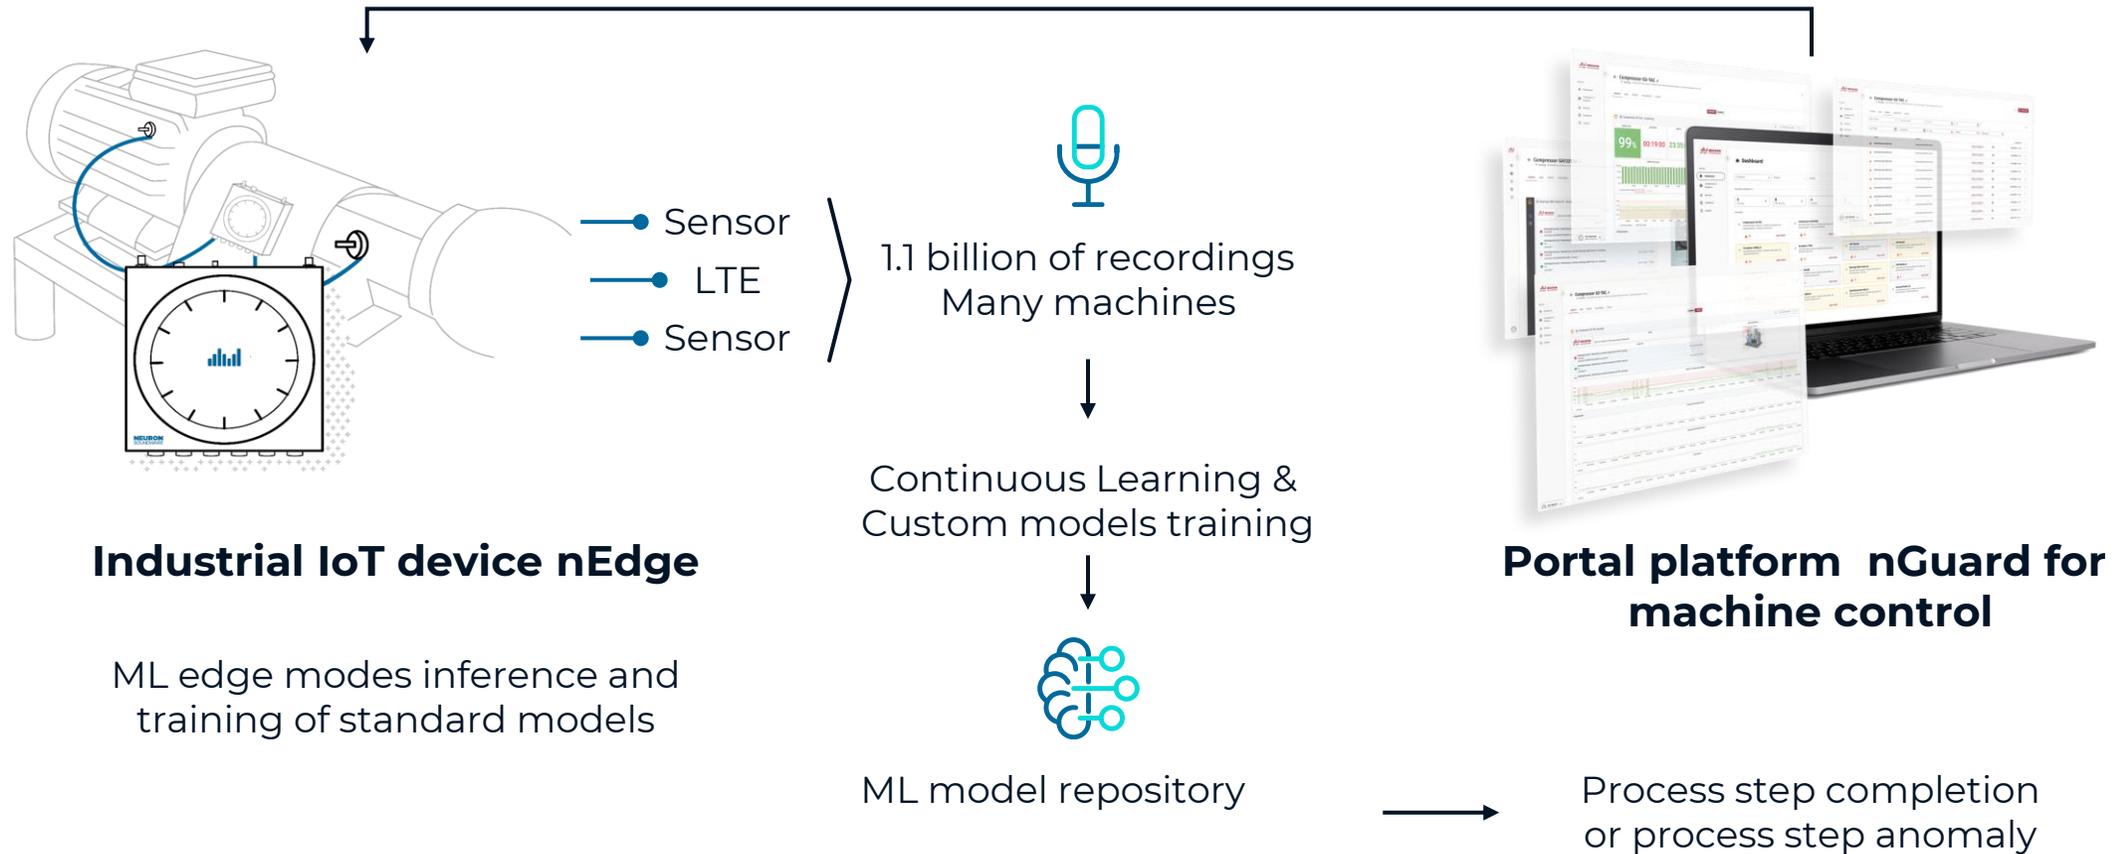

High maintenance cost

30% savings

All-in-one solution: AI + IoT

End-to-end customizable monitoring platform for machine monitoring & intelligence

Internationally acknowledged as an unparalleled innovator

Team of 20 Experts based in Prague in Czech Republic

nEdge™ IoT Hardware & Data

Edge computer

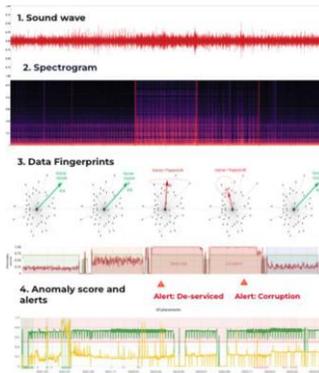

- Processes data locally - AI on the edge
- Instant machine health check
- LTE / LAN connectivity
- 4-16 sensor inputs
- Variability of sensors

nGuard™ SW Platform

Model training

- Variety of fundamental ML Models (MB – GB size)
- Anomaly detection/ Classification / Time-wise prediction
- Fully supported for end users including data labelling and training

7 Years of Development and Testing

1.1 billion recorded sounds

Own design IoT devices

Own data analysis platform

In the Top 5 in the World for AI Algorithm Design

10+ International Awards for Innovation

Top 5 innovators in the world in the IoT

The Best European Manufacturing Innovation & Technology Startup

Top 5 in the world AI-powered audio diagnostics

The Best IoT Startup Central Europe

ABB Open Innovation PDM Solution

Top 5 Digital Maintenance Solution Engineering Startup

Named as Mainstream in "Acoustic Deep Learning data processing"

Cool Vendor in Acoustic Technologies for PdM

130 installations in variety of industries

The same technology brings three major recurring revenue streams: SAAS, Licensing, Activation fee (IoT)

General manufacturing
(Robots, CNCs, Quality assurance, process monitoring)

Transportation & mobility, smart cities, Facility management

Energy, CleanTech, Power distribution

CNC metal working

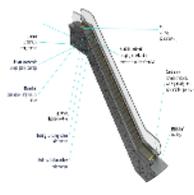

Welding, additive manufacturing

Robots

HVACs

Escalators

Facility management

Transformers

Wind turbines

CHP Units

Industrial IoT device

nEdge PRO – high end computing device

The next generation of **IoT device designed for edge inference**. It is equipped with **Nvidia compute modules Jetson Nano / Jetson Nano Orin** with up-to **40 TFLOPs and 8 GB RAM** of computing power.

The IoT device has a modular design and can connect **up-to 16 analog and variety of digital sensors** via ModBUS interface:

- Up-to 2x CARD for 8x IEPE sensors for acoustics emissions of machines
 - Up-to 2x CARD for 8x A/D HAT extension sensors (4-20 mA standard)
 - Other CARDS can be designed on-demand (e.g. 2M Hz recording)
- **LTE capable** with easy accessible SIM slot connectivity + **secondary eSIM card** with Global data plan for the remote device recovery
 - Advanced monitoring of the device with remote recovery option and **local storage data encryption**
 - **Touch display** providing with basic information on device/machine

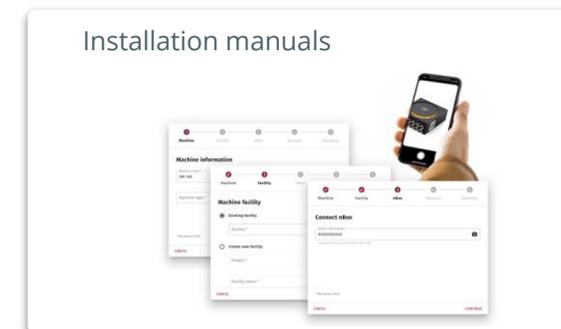

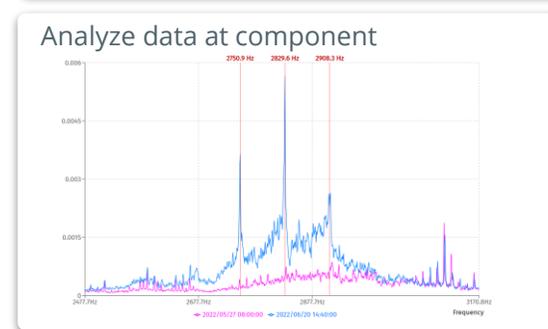

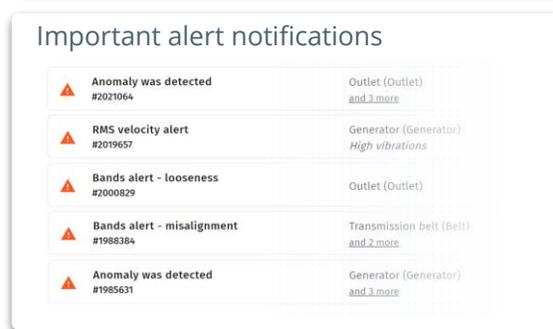

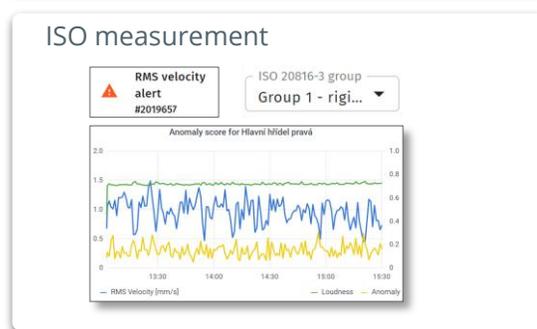

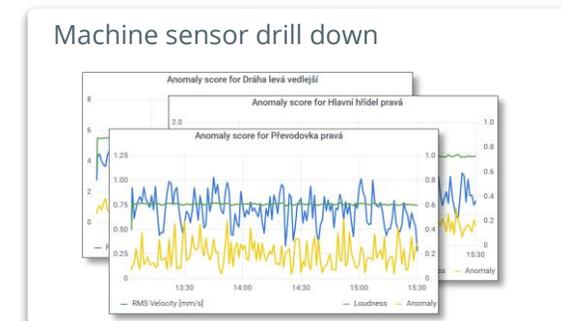

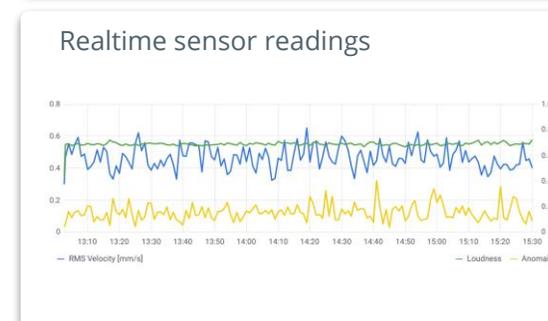

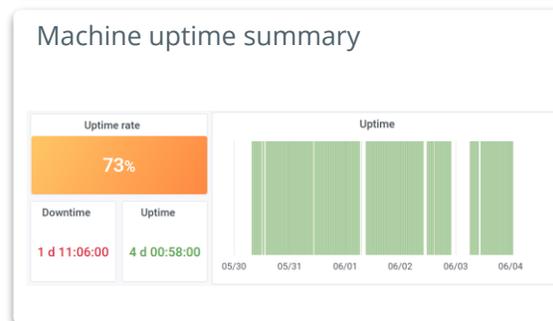

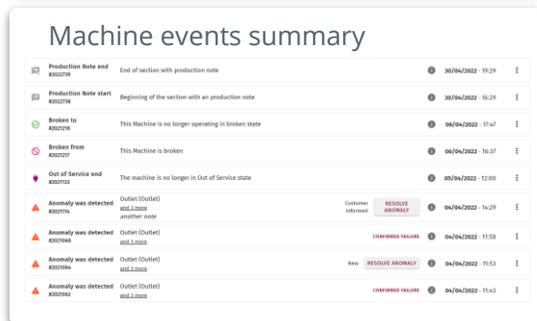

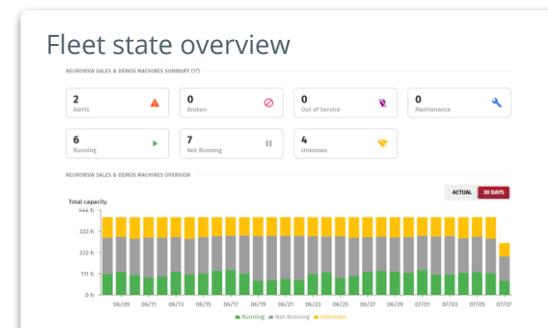

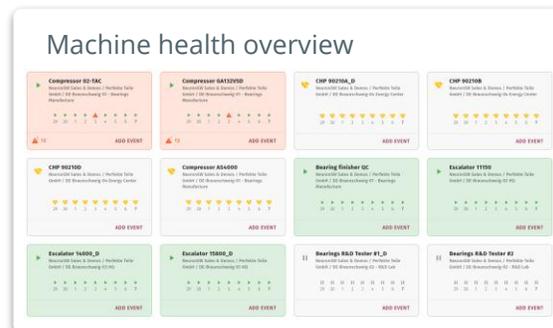

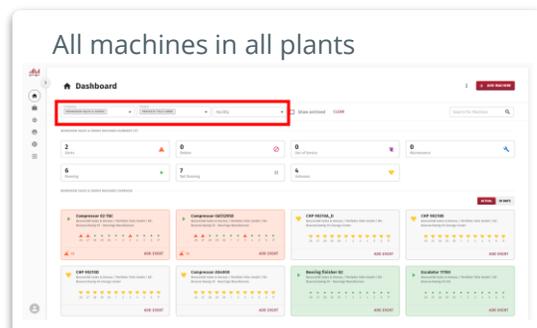

Features overview

Customer Portal

Our solution is all-in-one (HW+SW+AI). The front-end portal provides simple to use responsive interface for our users.

#AI is 4x more likely to detect a coming issue

- Client can observe in nGuard on **which machine part** the changes in sound occurred and **see the development of anomaly** as the time progress.
- In nGuard system the client can **label the test data**, manage **list of events** and use the **integrated analysis tools**.
- The system would be able to detect changes on particular components and advice the possible cause.
- AI Assistant allows instant consultancy using provided service and operation manuals.

Example of LLM output based on initial automatic prompt

AI Assistant

We have asked the following questions. The conversation will remain accessible for 30 days.

Event: An anomaly is detected.
Machine category: Escalator category
Machine subcategory: Escalator
Anomaly detected on placement: tracks
Language: English

Initial automatic prompt

Immediate Actions to Take

- 1. Inspect and Adjust Leading Guides and Tracks**
 - Conduct a thorough inspection of the escalator tracks and guiding elements to ensure alignment, and adjust any misalignments.
- 2. Check for Obstructions in Track Area**
 - Verify that there are no foreign objects or debris obstructing the escalator tracks, which could result in vibrations or operational failures.
- 3. Review Maintenance Records and Schedule**
 - Examine the maintenance logs to confirm that all prescribed maintenance tasks are up to date and ensure that regular checks of vibration and noise levels are being performed.

First step actions to be taken by maintenance personnel

Event labeling visible in both graphs and event list

Sensor data overview at 1 graph: Monitor the trend of different parameters on each sensor in real time – loudness (overall sound energy), anomaly score (deviation from nominal state) and RMS velocity (value of vibration) to have a basic knowledge of a machine operation in any given time.

Big Trend: Shift towards AI & Edge computing

Neuron soundware is uniquely position to satisfy an increasing demand for operational efficiency across variety of industries or products.

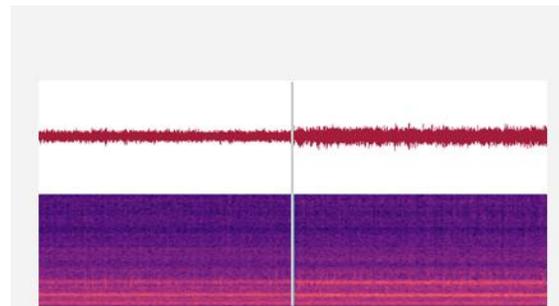

Key advantages

1 Multi-parametric, **real-time** data processing

2 Proprietary Edge IOT HW, Web based SW + **Plug&Play** integrations

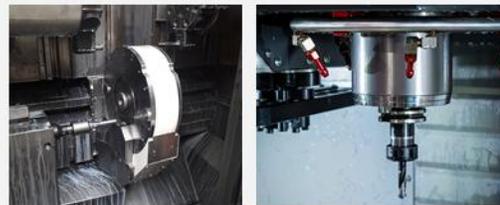

3 Rapid AI Algorithms **self-adjusting** to machine state monitoring

CNC Maching Health

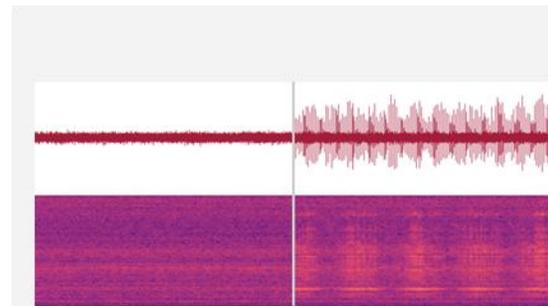

ORIGINAL STATE

DEFECT STATE

THE MOST COMMON PROBLEMS:

DEFECT STATE

THE MOST COMMON PROBLEMS:

- Imbalance
- misalignment
- overheating
- bearing failures,
- pump cavitation

Linear Axes/Guides Monitoring

OK STATE

DEFECT STATE

THE MOST COMMON PROBLEMS:

- Insufficient lubrication,
- flaking,
- indentations,
- corrosion,
- damaged ball recirculation parts

Milling process optimization – 120k EUR per station

Challenge

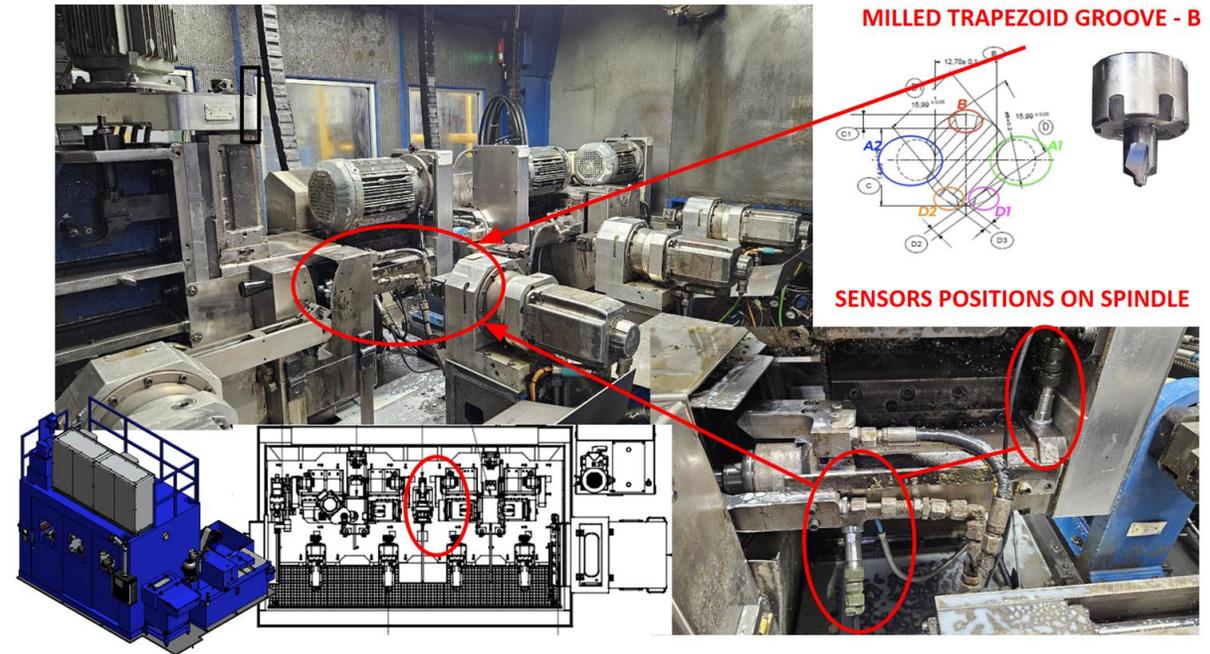

The aim was to **predict the remaining tool life before the breakage of milling tools** used for SDS Max chisels/drill bits. Monitoring the surface quality of the milled groove, which reflects the sharpness of the milling tool, is crucial for maintaining production quality. The operators were to record the burr level on the products produced, using a scale from 0 to 5, based on their judgment. The data were used for the training of the model predicting tool deterioration - Burr level.

Solution

The models can currently be used to **standardize the tool change**, without the need for operator judgement. The first model detects when milling is taking place by the sound, the second model detects the condition of the burr and the third model detects the occurrence of the broken tool.

Benefits

Reduced reworks and boosted productivity benefits **120k EUR per year/station**.

Grinding process optimization – 15% faster

Challenge

Acoustic analysis can significantly **improve first touch detection accuracy**, potentially enhancing grinding process control and machine productivity.

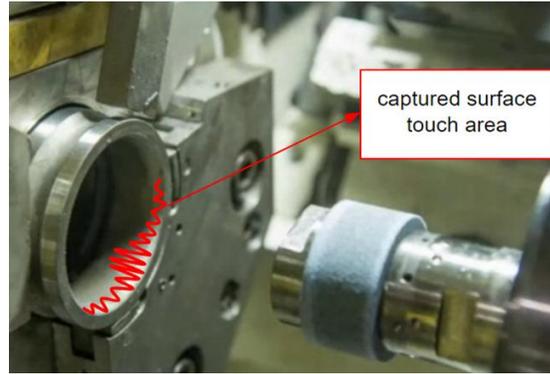

The reliable detection of the first touch between the workpiece and the tool in milliseconds is key parameter to **optimally control the machine speed and save production time**.

Solution

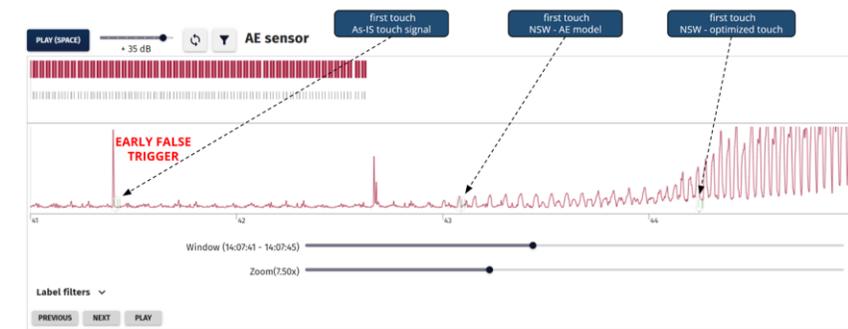

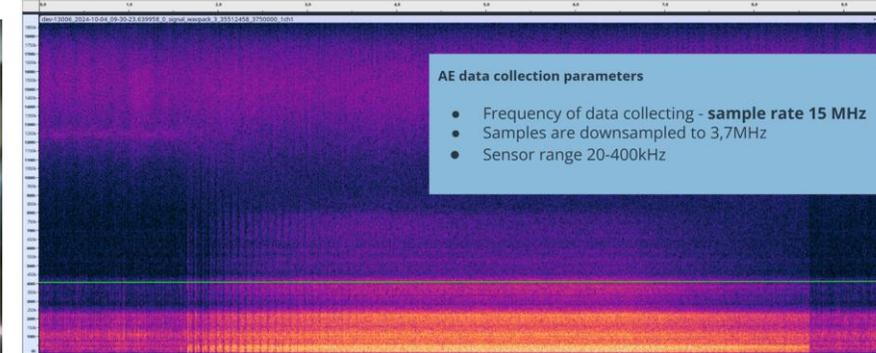

The reliable detection of the first touch allows to **speed-up the manufacturing process**. The further benefits are coming from the need of the **tools replacement and product quality optimization**.

Benefits

Production efficiency increased by 15%. That brings about more than 1.2 million EUR worth of production.

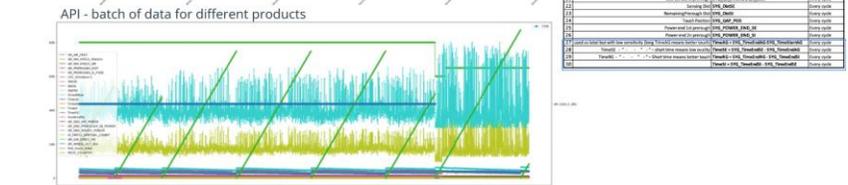

captured surface touch area

Wire drawing process – save 30.000 kg of material

Challenge

Welding wire coated with copper is pulled through a drawing die at a speed of 24 meters per second.

This **drawing wire is extremely sensitive to damage**, and any harm inflicted upon it leads to the rejection of the entire production batch, resulting in **substantial losses of both time and materials**.

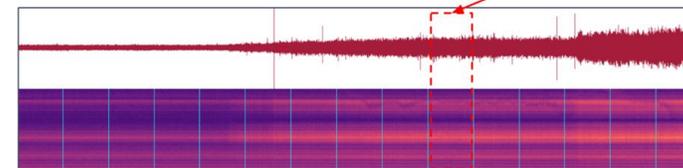

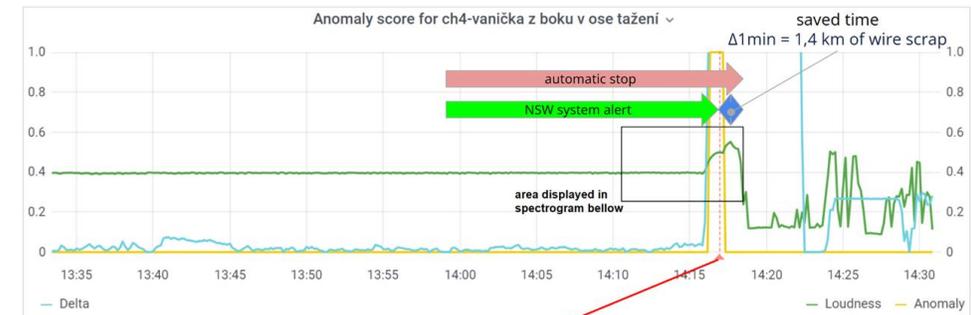

Solution

NSW solution **monitors the drawing mechanism and the integrity of the die**.

NSW correlates the data obtained with the production specification and in case of any deviations from the pre-set specification, **the line is stopped, and the problem areas are corrected**.

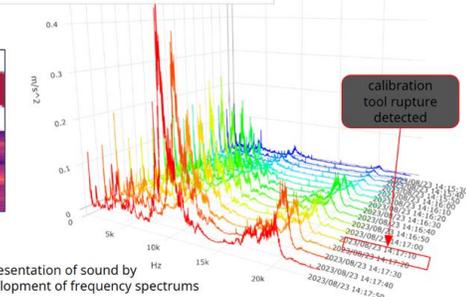

Benefits

Significant material savings (30t of material per year per production line). Dramatically reduced unplanned downtime. Improved productivity. Increased reputation as a reliable supplier.

sound development in time (spectrogram visualisation)

calibration tool rupture detected

representation of sound by development of frequency spectrums

Cutting process optimization - 100% speed-up

Challenge

Improper cutting speed and inappropriate contact between the cutting wheel and the material can result in damage or burning of the workpiece. This necessitates heightened operator attention and manual monitoring to prevent material loss and scrap.

Solution

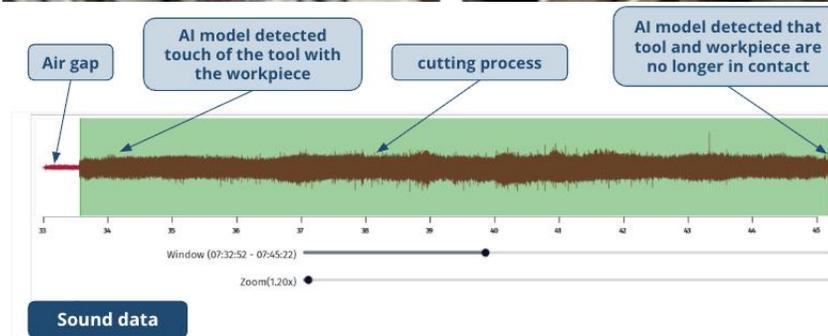

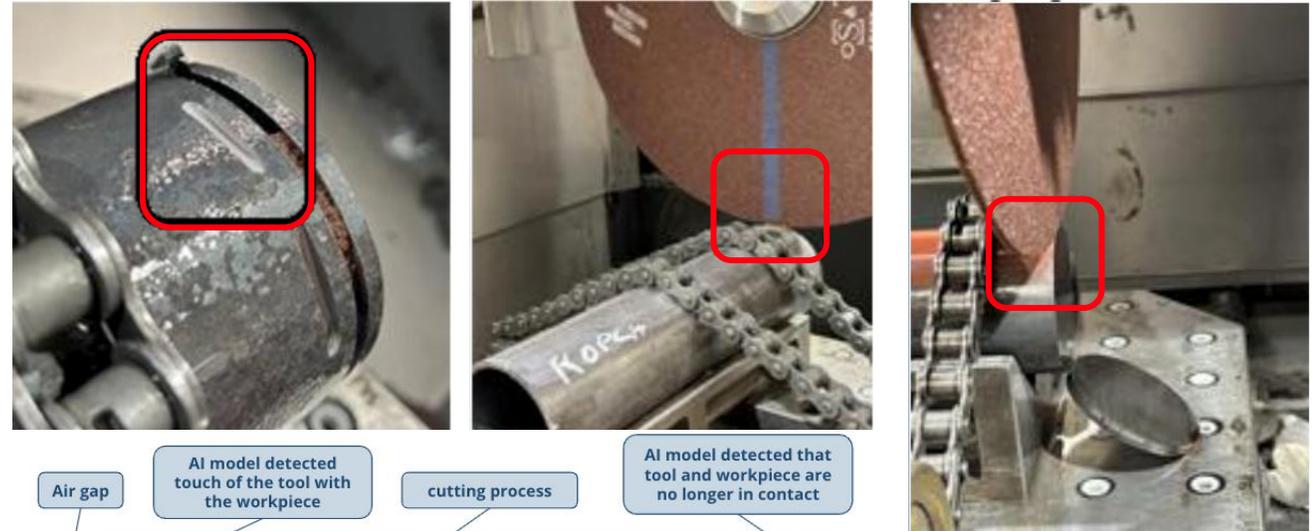

Automated **error-free touch detection, cut termination and ejection** system based on **acoustic monitoring** (Neuron Soundware nEdge IoT equipment) to **detect the point of contact** of the cutting tool (wheel) with the material/end of the cut.

Benefits

Process Optimization: Enable the **optimization of cutting conditions.**

Efficiency: Allow for the **acceleration of sampling.**

Automation: Enable the **automation of the cutting process** (specifically, touch detection and cut termination).

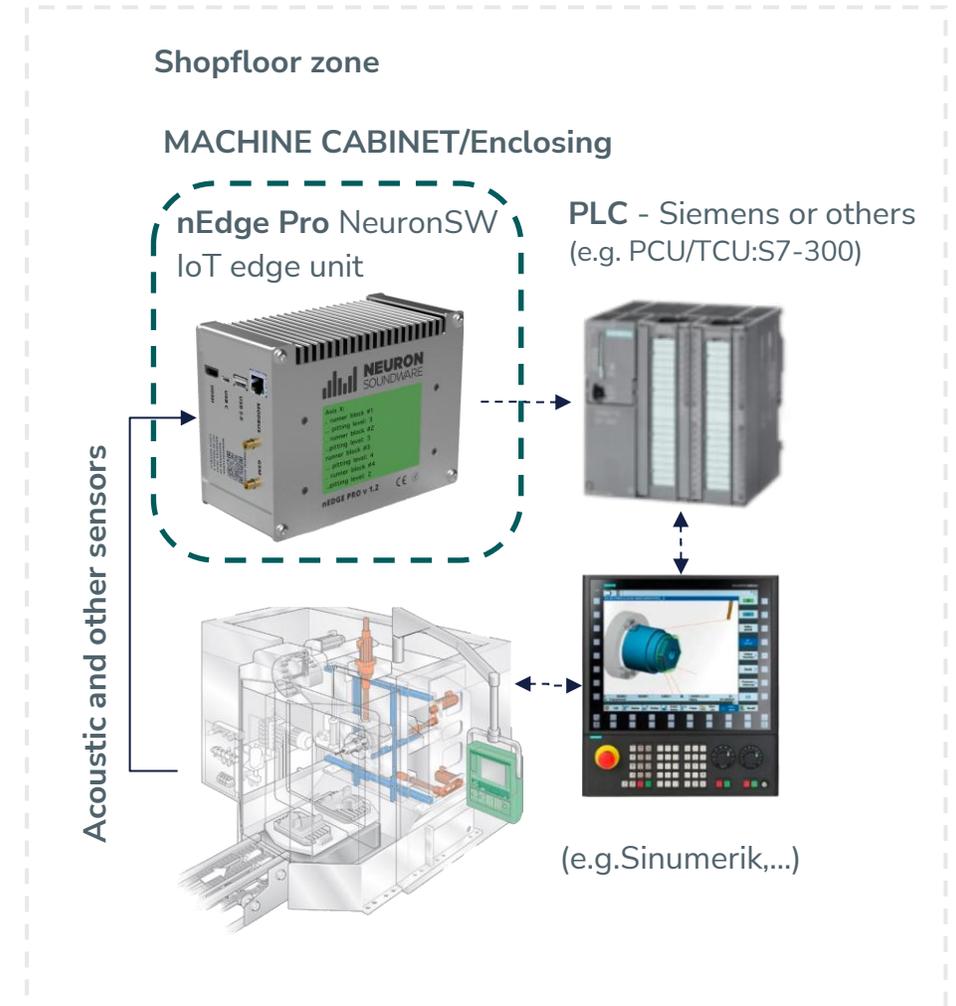

Neuron Soundware: AI + IoT for CNC optimization

Goal: **Optimize CNC machining in real time** by application of an advanced **Artificial Intelligence** (Reinforcement Learning, Anomaly detection, LLM ~ Techniques) + **IoT edge computing device**.

Core pillars of the technology:

- 1. Automated process planning & G-code generation:** Heuristics + LLMs to speed up CAM prep (up to ~90%) and optimize sequences (15–25% faster).|
- 2. Real-time anomaly detection & correction** — acoustic/vibration monitoring to detect chatter, collisions; ms-level reaction to prevent damage and cut downtime (~50%).
- 3. Adaptive real-time control (Reinforcement Learning)** — dynamic sensor feed/speed adjustment to shorten cycle times (≈20–30%), reduce defects and extend tool life.

Expected impacts: Faster setups, fewer rejects, energy/material savings (5–10%), scalable modular platform for broader industrial adoption.

AI in manufacturing Twist grant
of **IM EUR** (2025-2027)

We are looking for partnerships

We are looking for a strategic partner **with a focus on industrial AI and IoT**, who will help us with to expand our international reach.

Interested into the following areas:

Global Reach:

Geographic growth and distribution channels

ISO 45001: 2018

ISO 27001: 2022

OEM:

Deployment of the solution for key assets monitoring

ATEX

European Commission
Horizon 2020
European Union Funding
for Research & Innovation
EXCELLENCE

Large Operators:

Monitoring of variety of assets

CERTIFIED by GES CERT
GES CERT
ISO/IEC 27001
