

Study programme Management of Industrial Systems

Generated: 22. 8. 2025

Faculty	Faculty of Materials Science and Technology
Type of study	Doctoral
Language of instruction	English
Code of the programme	P0413D270001
Title of the programme	Management of Industrial Systems
Regular period of the study	4 years
Cost	500 CZK per semester
Coordinating department	Department of Industrial Systems Management
Coordinator	doc. Ing. Šárka Vilamová, Ph.D.
Key words	quality management, economics and management, industry, information systems, automation and control

About study programme

The study program is based on a systemic, integrated concept of managing industrial activities and processes in market economy conditions. As a balanced interconnection of knowledge of industrial economics and management, advanced quality management and intelligent control systems with technical and technological knowledge, the study program is oriented mainly to production systems of the metallurgical, chemical and engineering industries.

Professions

- Scientific researcher for process control

Hard skills

- PCB design
- Organization management
- Industrial logistics
- Knowledge of maintenance management
- AD/DA converters
- ERP system
- Methods and tools of quality management
- Programming of industrial PCs
- Managerial knowledge
- Nondestructive testing - ultrasound
- Presentation and defense of work results
- Business administration
- Basics of labour law legislation
- The human factor in quality management
- Warehouse management
- Design of switching power supplies
- Knowledge of the theory of maintenance systems
- Quality control
- Industrial engineering

- Computer support for quality management
- Procedures and methods of quality planning
- Marketing
- Statistical methods of quality management
- Knowledge of battery systems
- Designing production systems
- Integrated management systems
- Knowledge of industrial management methodology
- Knowledge of signal processing methods
- Tax system of the Czech Republic
- Applied informatics and management
- Calibration and verification of sensors
- Knowledge of process optimization
- Knowledge of metallurgical processes in metal production
- Knowledge of automation
- Quality management systems
- Statistical methods
- Basics of spectral analyses
- Asynchronous generators
- Knowledge of process improvement methods
- Programming of industrial PLC applications
- C++
- Robot programming
- Knowledge of the quality system ČSN EN ISO 9001
- Accounting Act
- Basics of wage legislation
- SW 3D/CAD
- VAT Act
- Measurement of electrical and non-electrical quantities
- Production quality management
- Design of switching power supplies
- Financial instruments
- Income Tax Act
- Knowledge of mechanical engineering technologies
- Preparation of production
- 2D design programmes
- Financial reporting
- Basics of business law
- Demonstration of product conformity
- Design of analog electronic circuits and their simulation (Pspice)
- Python programming language
- Accounting
- Quality management
- Mathematical methods and analyses
- Production organization and management
- Knowledge of the basics of business economics
- Management methods
- Knowledge of data analysis
- Design of linear power supplies

- Low voltage
- Knowledge of quality monitoring and evaluation
- Budgeting
- Industrial automation
- Knowledge of IFS quality system
- Knowledge of management methods and techniques
- Change management
- Project management
- SW Matlab
- Management of production and pre-production processes
- Knowledge of technological processes
- C#
- Knowledge of the basics of marketing activities

Graduate's employment

Management of industrial business activities at strategic and tactical levels, including employment in design and research institutions. Top managers of industrial enterprises, management representatives for technical and economic areas of industrial business, quality management systems and integrated management systems, information systems and technologies. Engineers and specialists in technical, economics, marketing, quality management departments, third party conformity assessment bodies, departments related to modernization of automation-based technological and manufacturing processes, creation and use of computer networks, implementation and management of enterprise management and information systems.

Study aims

The aim of the study program is to equip students with a balanced knowledge of the principles, approaches, methods and tools of the industrial management economics, the theory and methodology of integrated industrial management with technical and technological knowledge. The study is focused mainly on production systems of the metallurgical, chemical and engineering industries. The program covers the fields of economics and management of industrial systems, advanced quality management and intelligent control systems in industry.

Graduate's knowledge

- Management and managerial decision making while respecting the economic, technical and organizational and logistics specifics of metallurgical, chemical and engineering production. Reflection of integrated management theories, approaches and methods in real management processes.
- Managerial economics and its technical and technological specifics in industrial systems. Advanced tools of economic diagnostics of industrial business entities.
- Concepts, methods and tools of modern quality management and their application in production and non-production spheres. Special statistical methods of quality management. Advanced procedures for planning and improving quality and their application in various industries.
- Principles and procedures for integrating management theories, concepts and systems. Development and application of models of excellence in industrial organizations.
- Modelling and simulation of dynamic systems. Theory of optimal control and automation of technological processes. Projection and programming of information systems.

Graduate's skills

- Designing an industrial business and supply chain strategy. Management of the property and capital structure of a business entity. Innovation management. Evaluation, improvement and design of business processes in industrial sectors.
- Implementation and maintenance of quality management systems and integrated management systems. Application of system

approach to solving problems in the field of products and processes quality. Application of statistical methods. Evaluation of maturity of industrial organization management systems.

- Creative solutions to individual elements of control systems and their integration. Analysis, design and implementation of automatic regulation of technological processes using modern methodologies, measuring, control and computer systems.
- Forming and managing the work team. Argumentative evaluation of team work results.
- Pedagogical work on the basis of professional knowledge and generalized experience of the graduate.

Graduate's general competence

- The ability of independent scientific research and independent creative activity in the field of industrial systems management.
- Ability to design and use advanced research practices in a way to extend the current state of knowledge - at all levels of management of an industrial business entity.
- Self-decision-making ability in the business sphere - with a view to working in a competitive environment of the globalized economy.
- Ability to understand and convincingly present their own economic and managerial skills and solving problem practices to other members of the scientific community at international level (at least in one world language) and the general public.

Study curriculum

- form Full-time (en)
- form Part-time (en)
